

C4D Visuals: Custom Controller Overlay Tool Requirements

This document outlines the requirements for a desktop application that generates customized, interactive controller overlays (as .html files) for use in OBS/Streamlabs.

General Design & Functionality

- **Theme:** The application must feature a black, red, and white dark-themed user interface.
- **Purpose:** To mimic the functionality of gamepadviewer.com, allowing users to download custom overlays as HTML files for use as local browser sources.
- **Input Handling:** Each controller section must display a "Connect [Specific Controller]" status until the device is plugged in or a

button is pressed.

Controller Support & Visualization

Sections Required: Dedicated sections for PC (Mouse & Keyboard), PS5, PS4, and Xbox One.

High-Fidelity Rendering: Instead of basic API hitboxes, the software must render the actual 3D contours of buttons based on user-provided templates to ensure accuracy.

Trigger Pressure: Trigger button animations must fill proportionally based on the amount of pressure applied.

Thumbstick Functionality:

Thumbsticks must function in their correct locations.

They must include axis-tilt animations using user-provided thumbstick assets.

.

- **Customization & User Control**
 - **Individual Component Control:** Every button press, including thumbstick zones, must be fully movable, scalable, and customizable (e.g., color, opacity, glow, and inner fade).
 - **Asset Uploads:**
 - **PC Section:** Includes upload buttons for custom mouse and keyboard skins (.png or .mp4).
 - **Controller Sections:** Includes upload buttons for custom controller skins and individual thumbstick assets.
 - **Requirements:** The interface must explicitly display the required pixel dimensions for all uploaded files.
 - **es.**
 - **Mouse Specifics:** The mouse overlay must mimic physical movement; it

requires inputs for left-click, right-click, scroll wheel, and two side buttons.

Output & Final Delivery

Functionality: Once configured, each controller/device can be named and exported as a fully functional .html file.

Deliverables: Upon completion, the developer must provide the individual .html and .css source files for personal use.
